BUILDING AGENTIC AI APPLICATION CHALLENGE · NOVEMBER 2026

Demo Video Recording Guide

3–4 minutes · real app · synthetic student data

Status

Item	Status
Automatic captioned cut (scripted test model, labelled)	Recorded: 2:13, demo/out/catchup-ai-demo.mp4 + .srt
Final cut with the live model	Not recorded yet (live model now available)

Title and description

Title: CatchUp AI: an agentic copilot that helps students recover after missing a lecture

Description: A student misses a regression lecture with a worksheet due. CatchUp AI reads her notes, cites the pages, checks whether her week can fit the work, and drafts a recovery plan that only takes effect when she approves it. Live app and code linked below.

Scene sequence and narration

Time	Screen and clicks	Narration	Caption
0:00	Open the live URL in a fresh browser	Priya missed her regression lecture, and her worksheet is due Friday.	A missed lecture, a close deadline
0:15	Click Try the demo, no sign-up	One click opens a demo account with made-up data.	One-click demo, synthetic data
0:30	Mission control: point at deadlines and capacity	Everything here comes from her own deadlines and free time.	Mission control
0:45	Catch-up pack → choose the lecture → open p. 2	Her notes become a summary, key terms and check questions, each linked to a page.	Every point links to its page
1:10	Copilot → type: I missed the regression lecture… → Send	The agent decides what to look up. Each step here is a real tool call.	Real tool calls, in order
1:45	Point at the citation and the facts vs suggestions split	Facts cite her pages. Advice is kept separate.	Facts cite pages
2:05	Recovery lab: compare the three routes	A fixed algorithm, not AI, checks the time. One route doesn't fit, so it can't be approved.	Three honest routes
2:30	Review in lab → approval dialog → Approve plan	She sees every block before saving. Approval saves exactly once.	Approve once
2:50	Study schedule → Why this plan?	Here's the record: pages used, tools that ran, model, time and tokens.	Why trust this?
3:15	Universe → Insights → /quality	Finished blocks grow her forest. Every number on the quality page is generated.	Evidence anyone can check
3:40	End on the URL	CatchUp AI: evidence first, student in control.	catchupai-chi.vercel.app

Recording checklist

1. Live model connected (the copilot chip shows the model name, not 'Scripted test model').
2. Fresh browser profile, 1920×1080 or 1280×720, notifications off.
3. Synthetic data only; no email, keys or terminal on screen.

4. Record twice; keep the cleaner take. Add captions (SRT).
5. Upload unlisted to YouTube or Loom; paste the link into the Day 8 form.

Backup plan

If the live model is slow or rate-limited during recording, record the copilot segment separately and splice it in, or use the labelled scripted cut and say so on screen. Never present the scripted model as live AI.

Judge Q&A

- **What's agentic?** The model chooses tools and their order at run time; every call is real and logged; it can draft but never commit.
- **Why not more agents?** One well-bounded agent is easier to trust and to test for something that touches a student's week.
- **What if the AI is wrong?** Unsupported facts are removed, advice is labelled, and the plan's numbers come from code.
- **Privacy?** Each student sees only their own data (row-level security); the demo uses synthetic data, deleted after 24 hours.
